Have you ever had a problem trying to get the bead of a tire sealed where the tire may be on the unit where you don't want to take it off or the tire is off the unit. Here's a way to help seal the bead with little effort. I have a tie down strap that I wrap around the tire, pull out the valve core and put some tension on the strap to help the bead seal while I apply air to it. Once the bead seals I put the valve core back in and remove the strap and fill to desired pressure.
