

Hub puller

I always have a problem getting hubs of some of the machines . I'm a little limited in my tool supply and my sliding hammer never seems to work well and I never seem to have the right puller, So I did this instead and it came off fairly easy . I took a bolt and coned the end and placed the bolt through the hub puller with a nut on the back side . I held the nut and used the air gun to blat it off . I also hit the side of the hub 180 degrees of each other and tapped the bolt . Took less than 5 minutes .
