

verticutter sharpening

I looked at stacking the plates up and using an 1/8 rod through the holes to line it up for sharpening ? How do you grind them and keep them even ? I looked at the bar and stacked the 1/2 spacers on the bar and put the plates inline with the other 1/2 on the other side and ground it on the single blade foley that I have using the top face stone and front face stone . On the second unit I put the front face stone on the horizontal and it worked way better . Phone pics turned out pretty good .
